

Computer Adaptive Testing

WHAT IS COMPUTER ADAPTIVE TESTING (CAT)?

A group of questions used to gather information about your health.

HOW DOES IT WORK?

- 1 Start by answering the first question.
- 2 The CAT picks the next question from a large group of questions based on your response.
- 3 Continue answering questions while the CAT estimates your abilities, usually represented as a number. This should only take between 4-6 questions.
- 4 Your provider can help you understand what your score means and together you can set goals and make decisions about your care.

WHAT DOES THIS MEAN FOR YOU?

Questions asked are specific to YOU

Accurate information about YOUR health

Fewer questions...saves YOU time

More time working with your provider to address YOUR needs
